

Strep-tag[®] removal after protease cleavage

Generation of processed protein using biotinylated proteases

Incubate your purified recombinant *Strep*-tag Protein of interest after removal of desthiobiotin with a commercially available biotinylated endoproteinase*.

After digestion, apply the mixture on a *Strep*-Tactin Column. The biotinylated protease as well as potentially uncleaved *Strep*-tag protein will bind to the column.

Only the cleaved protein without *Strep*-tag will flow through the column.

* factor Xa or thrombin
